

[OPENING - 0:00-0:30] "Right now - while I'm speaking - someone in the world is having a stroke. In the time it takes me to finish this sentence, another one will follow. And here is the part nobody talks about: surviving a stroke is only the beginning of the nightmare."

[PROBLEM - 0:30-0:55] "86 million people today need stroke rehabilitation. More than half of them - living in low- and middle-income countries - will never receive a single session. Not because rehab doesn't work. It works. They just can't reach it. We built Synaptic to change that."

[CONTEXT PUNCH - 0:55-1:10] "Stroke is the world's single largest cause of adult disability. 93.8 million people are living with its effects today, and 11.9 million new cases are added every year. The disability rate in wealthy countries is 38%. In LMICs? 77%. That gap - 77 versus 38 - is not a medical gap. It is an access gap. And access gaps are solvable."

[PRODUCT REVEAL - 1:10-1:50] "So what does the solution look like? It doesn't look like a hospital. It doesn't look like a specialist who costs \$200 an hour. It looks like the cheapest Android phone in the room."

"Synaptic is an edge-AI stroke rehabilitation platform that monitors vitals, coaches patients through exercises and runs by voice in their own language, and tracks every movement of their recovery - running entirely offline, on any smartphone, from anywhere in the world."

"Recovr is a wearable that monitors vitals continuously and sends an SOS to the community health worker the moment something is wrong. Phenome is a AI - offline, in 20 languages - that coaches patients through their daily exercises and drafts clinical notes in 7 seconds for the clinician to review. Cerebrum sees what no wearable can: using a phone camera, it tracks 21 hand landmarks in real time, scores every rep, and gives the patient a cue to correct form before the

wrong movement becomes a habit. And our unified clinical dashboard means the therapist, the CHW, and the specialist are all reading from the same data spine that is , getting real time data with no gaps or handoffs."

[WHY IT WORKS - 1:50-2:15] "And before anyone asks whether this actually works - we are not standing here on a hypothesis.

A UC Irvine clinical trial showed that home-based stroke rehab matched clinic outcomes on the Fugl-Meyer scale - the gold standard for motor recovery. Matched. Not approximated. Matched.

It costs less too. Home programs run \$853 per patient. In-clinic; \$1,490. A 43% saving - before you count a single bus fare or missed day of work.

And NYU's PrimSeq system proved that AI can track prescribed arm movements with 77% accuracy, ensuring patients actually hit the intensity their brain needs to rewire.

The science said telerehab works. The science said AI closes the dosage gap. The science said the cost is lower. Nobody built the infrastructure to deliver it at scale - until now."

[VISION - 2:15-2:45] "We are not building a rehab app. We are building recovery as infrastructure - the same way clean water and electricity became infrastructure. Because right now, the care cliff is real. 60% of stroke patients are lost to follow-up within weeks of hospital discharge. Synaptic closes that cliff, rep by rep, session by session, in 20 languages, on the lowest device in the room."

[CLOSE - 2:45-3:00] "86 million survivors. Four pillars. One screen they can actually use. We are here today not asking for

capital - we are asking for something harder to find:
attention. Because the first step to closing that gap is
making the world see it. That is what we are doing. That is
Synaptic."
